

Year 7 HASS - History

Unit 1

Investigating the ancient past

v1.0

Government
of South Australia

Department for Education

LEARNING AREA SUBJECT	Humanities and Social Sciences R-10		YEAR LEVEL	7		UNIT 1 OF 3
						5 weeks
Unit title	Year 7 History: Investigating the ancient past					
Description	Within this year 7 study, students develop an understanding and appreciation of how and why we study the ancient past, linking ideas to previous learning. Students are afforded the opportunity to cast a historical lens over the types of evidence we apply to understand pre-history. Student learning allows ample opportunities to relate ideas into their real worlds, allowing them to develop perspectives based on consideration of the types of evidence used to build historical understanding. Interpretations of different sources of evidence allows students to examine the methods historians use to develop a composite of the ancient world, respecting and developing empathy of our ancestors, and their place in the continuing human story. Students examine significant historical finds and mysteries such as the Lake Mungo archaeological discoveries within the Willandra Lakes region and the discovery of Tutankhamun’s tomb in Egypt, as well as a case study into the contentious cause of the young Pharaoh’s death. Collaboration and student research are encouraged allowing for interests and curiosities to be explored as well as opportunities for robust debate and defense of thinking and evidence, whilst simultaneously valuing the importance of team work in developing a breadth of understanding in the examination of history. Students are provided opportunity and encouraged to think critically, acknowledging how different interpretations of evidence transpire. Familiarisation is made with the thinking tools and available technologies to historians in the past and that their contemporaries apply, to reduce the contestability of evidence allowing the exposition of ancient truth. An understanding of how and why we need to value and protect ours and other’s heritage is fostered, allowing a respect for the ancient past to be adopted.					
Learning intentions		Unit sequence		Assessment tasks		
• Apply an historical lens to interpret the recordings of ancient history • Understand how historical evidence is revealed • Understand how the analysis of ancient human remains answers an historical mystery • Understand how Mungo Man can tell us about how people lived in the past • Understand why we should and how we can protect our heritage		• Artefacts: What we leave is what we are • Time tools: Measuring the past • Tutankhamun: A mysterious death • Australian stories: Mungo Man • Protecting our past: Keeping the legacy		The unit provides students opportunities to demonstrate their knowledge, skills and understanding through both formative and summative assessment. Each learning sequence supports teachers to use assessment evidence to make adjustments that facilitate student learning, improve instruction, and inform future teaching and learning. Five ‘key strategies’ that support the implementation of effective formative assessment are: 1. Clarifying, sharing, and understanding learning intentions and success criteria 2. Engineering effective discussion, tasks, and activities that elicit evidence of learning 3. Providing feedback that moves learning forward 4. Activating students as learning resources for one another 5. Activating students as owners of their own learning. <i>Source: Wiliam, D., Leahy, S., 2015, Embedding Formative Assessment: Practical Techniques for K-12 Classrooms, Learning Sciences International.</i> This unit includes an assessment task/s that supports teachers to collaboratively moderate. This will ensure consistency of teacher judgement of assessment evidence against the achievement standards in the Australian Curriculum.		

Achievement standard	By the end of year 7 students: • suggest reasons for change and continuity over time • describe the effects of change on different societies, individuals, and groups • describe events and developments from the perspective of different people who lived at the time • explain the role of groups and the significance of particular individuals in society • identify past events and developments that have been interpreted in different ways • sequence events and developments to create an appropriate timeline • develop questions through research to frame an historical inquiry • identify and select a range of sources and locate, compare, and use the information to answer inquiry questions • answer inquiry questions developed through locating and comparing information discovered in research • examine sources to explain points of view • interpret sources to identify their origin and purposefulness • develop texts, particularly ones that provide descriptions and explanations • develop texts by organising and presenting findings using historical terms, subject specific language, concepts, and sources • acknowledge their sources of information.				
Scope and sequence	Artefacts: What we leave is what we are	Time tools: Measuring the past	Tutankhamun: A mysterious death	Australian stories: Mungo Man	Protecting our past: Keeping the legacy
	Listing and defining the variety and reliability of sources that build historical knowledge and understanding. The variety of types of primary sources of evidence that allow us to piece together the beginnings of ancient societies.	The methods and tools historians and archaeologists use to investigate history and gather evidence when using archives and excavations.	Explore one historical mystery or controversy where historians have struggled to compose and resolve the case and examine the methods and sources applied.	Investigate one ancient Australian discovery and discuss how evidence allows us to better understand goings-on at the time regarding practices and the use of resources. Examine the Out of Africa theory, showing the movements and diaspora of populations approximately 120,000 years ago across the globe, including to Australia.	The importance of protecting Australia’s ancient Aboriginal and Torres Strait Islander heritage, and the threats to conservation of significant remains and sites.
General capabilities	Critical and creative thinking	Personal and social	Ethical understanding	Intercultural understanding	
	• Assess assumptions in their thinking and invite alternative opinions • Identify gaps in reasoning and missing elements in information	• Acknowledge the values, opinions and attitudes of different groups within society and compare to their own points of view	• Draw conclusions from a range of points of view associated with challenging ethical dilemmas	• Explain ways that cultural groups and identities change over time and in different contexts • Assess diverse perspectives and the assumptions on which they are based	

Unit delivery

Unit sequence	Artefacts: What we leave is what we are Learning intentions: Apply an historical lens to interpret the recordings of ancient history	
Teaching and learning	Teacher tips and alerts	Evidence of understanding
Subject specific language • Artefact: Human-made object from the past • Prehistory: Time before written language • Anthropology: The study of human culture in historical and modern contexts • Primary evidence: Original, first-hand records of a particular culture, event or time period • Secondary evidence: Information that is an analysis or interpretation of primary source materials	Examine the subject specific language (SSL) for each unit sequence, using this terminology in delivering content and context and expecting it to be reapplied by students to demonstrate understanding. Create living documents where possible, open to modification, growth and development as critical parts of the learning process develop. One form this can take is a Word Wall of SSL, adding terms as they are raised within the learning process. Placement in visible locations in the classroom will allow students to refer to SSL during dialogic and written exercises. Other examples include graphic representations, maps, Venn diagrams, mind maps and T-charts. A ' community of inquiry ' (COI) is recommended as a powerful classroom tool to open dialogue between teachers, students and the content and context. This type of learning requires interconnection between teacher, social and cognitive presence. A description of a COI is available at: • 'The Community Of Inquiry: It's (sic) Processes and Benefits' – SAPEA – https://sapea.net/?page_id=19	
Tuning in Our stuff: Is it important? Ask students to consider one of the following questions: • What do our objects tell us about us? • What's your most valuable possession? • How old is the oldest thing you own and how do you know? Provide appropriate wait time and share student experiences, valuing their contributions and thinking around the value, age and significance of ideas and examples to their culture in their real worlds.	When initiating class discussion, prompt student comments with the following points: • What do our objects tell us about us? – materials we value, our level of technology • What's your most valuable possession? – its material worth, its usefulness, its sentimental value • How old is the oldest thing you own and how do you know? – where the information about its age comes from, is it still useful, why do you keep it, is it older than you? When tuning in, encourage an ongoing conversation within the class cohort, bringing in, valuing, interpreting, clarifying and correcting student contributions to develop shared understanding. Learning should focus on how ancient artefacts tell us about how ancient societies worked and what they valued. Establish an understanding of the SSL term supported with succinct video explanations to elaborate and develop understanding.	Students can: Identify the cultural value and importance of objects in their lives.

Key terms: Words matter

Use this discussion to co-create a definition for the term **artefact** referring back to student contributions around examples of these objects.

Use the following resource to develop understanding:

Resource 1 – Studying the ancient past key terms

Present the following 5 terms, adding their definitions to the living Word Wall:

- **Artefact**
- **Prehistory**
- **Anthropologist**
- **Primary evidence**
- **Secondary evidence**

Students watch the following videos to support learning.

Video Resources

The role of anthropologists and the use of artefacts from prehistory to construct understanding:

- ‘The Essence of Anthropology’ – *The University of Tulsa* – 1:15 – <https://www.youtube.com/watch?v=BDlISuaO1Qc>

CGI of the oldest stone tools discovered at Lomekwi 3 in Kenya.

- ‘Lomekwi 3 - World's Oldest Stone Tools Predate Humans’ – SciNews – 2:24 – https://www.youtube.com/watch?v=GG_pFGRNeSs

Concise definition and visuals of the term artefact:

- ‘Artifact - Art Vocab Definition’ – *Philinthecircle* – 0:19 – <https://www.youtube.com/watch?v=Btng0Hm3Gk>

Clarify any points of interest from the videos and allow students appropriate time to complete the task sheet, creating a sound definition, applying the significance of the idea to understanding history and completing a brief sketch, icon or symbol that they feel represents this term.

When presenting the idea of an artefact consider bringing or showing a personal object that could be described as an artefact.

The idea of prehistory is important in students’ understanding that written history is only approximately 5,500 years old and historians have to compose an understanding of ancient history through artefacts, sites and unwritten records.

Use the following prompts when addressing the explanations and fostering student development:

- **Artefacts** – state that the oldest stone tools were found in Kenya (Africa) and have been dated at 3.3 million years old.
- **Prehistory** – state the first appearance of written records to around 5,500 years ago in Sumer (southern Iraq). Often, unwritten records before that are open to interpretation and often contested.
- **Anthropologist** – state their job is to discover, study and interpret ancient evidence and compose an understanding of those societies. Fictional professor Indiana Jones was an archaeologist which is a branch of anthropology. Archaeologists find and study objects whilst anthropologists use that to understand cultures. Anthropologists could be seen to work with primary evidence to create secondary sources.
- **Primary evidence** – primary sources are evidence from the time (first hand)
- **Secondary evidence** – secondary evidence is an analysis and explanation of the primary source (second hand).

Students can:

- Define SSL that relates to the study of ancient history.
- Interpret their understanding in a graphic form.
- Relate SSL the study of ancient history.

Ancient clues: Artefacts talk

Ask students to consider the following question:

- What are some artefacts or objects from the ancient past that can help us understand how civilisation operated?

Allow students to contribute interesting ideas noting them on a board and valuing their responses.

[Resource 2 – Wagon Wheel](#)

Place students into six groups and provide each group with a wagon wheel and one of the following types of **primary evidence** that shaped ancient civilisations, to discuss and brainstorm:

- Pottery and ceramics
- Tools and weapons
- Jewellery and ornaments
- Carvings and paintings
- Buildings and ruins
- Human remains.

Groups use available online resources to discover one example of an artefact or remains that relates to their topic and what it tells us about the community that created it.

Students reference the sites used to investigate their element, applying appropriate referencing conventions.

Students return to groups and share thinking and findings, with one student being a spokesperson to share group thinking and discoveries.

This sub-section allows for the exploration of how ancient (prehistoric) primary evidence was used by historians to construct an understanding of ancient societies. Student artefacts and remains are primary sources of evidence that can be used to create a composite of contemporary civilisation, allowing an understanding to develop on how interpreting these sources allows historians to shape ideas about ancient societies.

Establish the knowledge that human remains and artefacts (not only writing) have been used to reveal the ancient past.

This unit sequence should be used to engage students by identifying and valuing their contributions throughout the learning process.

Wagon wheels allow students to generate ideas and attach thinking to a graphic representation of knowledge and understanding. When students are undertaking their wagon wheel brainstorming activity, guide and support group ideas for the six spaces using some of the following prompts:

- **Pottery and ceramics** – skills and materials used, what they ate, significant designs, creativity
- **Tools and weapons** – skills and materials used, what they made, level of technological development, what they ate, how they fought
- **Jewellery and ornaments** – skills and materials used, what they believed, what they valued, creativity
- **Carvings and paintings** – skills and materials used, what they believed, what they did every day, spirituality, creativity
- **Buildings and ruins** – skills and materials used, where they lived, designs and architecture, size of communities, places of worship
- **Human remains** – DNA, features, diet, health, rituals, tattoos/markings, injuries.

Students' thinking should be valued and showcased, placing it in a visible space after being shared by the class cohort.

When referencing online resources, model an exemplar of 'online referencing' on the board; allowing students to query the reasons for necessary information and duplicate the process within their own groups.

Students can:

- Collaborate to develop understanding of how ancient evidence allows the past to be interpreted and valued.
- Use online resources to support group thinking.
- Reference a source applying an appropriate convention.

Stuck in time: What our artefacts tell about us

Ask students to consider the following question:

- What different ways can the human body be preserved?

Students watch the following video on how bodies decompose and how humanity has treated bodies and burials throughout history.

Video resource

- ‘What happens to our bodies after we die?’ – Farnaz Khatibi Jafari – *TEDEd* – <https://ed.ted.com/lessons/what-happens-to-our-bodies-after-we-die-farnaz-khatibi-jafari>

Wonderings and ponderings regarding the video should be shared.

Present four types of natural preservation that could occur:

- freezing
- falling into a tar pit
- dust storm
- volcanic eruption.

After clarifying natural systems that can lead to preservation, document learning that these natural phenomena can preserve humans and their possessions. This should be related back to how prehistoric artefacts and remains can be preserved through natural processes.

Present a hypothetical where a student on the way home from school is involved in a cataclysmic natural event and they are entombed for 5,000 years.

Resource 3 – Remains of the day

Within the hypothetical, students complete the task sheet to compile a list of 5 artefacts or remains that they predict would be expected to be found when the body was exhumed, identifying:

- the artefact or remains
- why they remained preserved, considering resilience and material strength as well as the system of preservation
- how the primary evidence might be mistakenly interpreted by historians in the future who are unfamiliar with these objects.

Students can record items such as bones, teeth, phones, keys, jewellery, money, braces and food wrappers.

Students could also be asked to address how they would feel if their remains were stolen by tomb robbers or how they would feel about their remains being displayed in a museum or becoming a tourist attraction.

Lost then found: Summative assessment

Students create an original narrative piece of writing where fictitious **anthropologists** discover their remains and the 5 **artefacts** from the previous task; having no idea what they were or are. The anthropologists describe the method of preservation and a creative misinterpretation of the evidence, with their descriptions of the role these artefacts played in everyday life 5,000 years prior to their discovery. Students have to demonstrate how historians might interpret why these artefacts may have been critical for individuals to participate in the civilisation at the time. In effect, students will be using **primary sources** to create a **secondary source** of evidence. Students should apply SSL within their response.

When discussing death and decomposition, do so delicately as students may have recently lost loved ones. Handle the discussion with a scientific tone.

A quick identification of the effect of different types of preservation and conservation of the remains can be used to frame learning, supported by other visual cues and sources that show how this preservation has occurred:

- **Blizzard** – freezing stops or slows the processes that cause decomposition of organic (plant and animal) tissue, preserving them
- **Tar pit** – a lack of oxygen in the sticky tar and bitumen slows decomposition
- **Dust storm** – shrouded in hot, dry desert sands desiccates (dehydrates) soft tissue, preserving it.
- **Volcanic eruption** – fine ash can create a protective shell without crushing or burning human tissue.

This sub-section provides excellent opportunities for students to document individual ideas through the lens of an anthropologist who would be analysing an ancient unknown artefact. Phones could become sacred religious stones, keys become files, braces could be mouth tiaras to display wealth, food wrappers become sacred texts, etc Students could also propose how scars, makeup, fabrics or motifs and emblems on their uniform could be interpreted.

An interesting text that mirrors this exercise is ‘The Body Ritual of the Nacirema’, a fictitious, humorous anthropological study in the 1950s by Horace Miner, where every day behaviours and actions of modern Americans (Nacirema is American spelt backwards) are interpreted mistakenly through the distorted lens of anthropological observation of an ancient civilisation.

- Body Ritual Among the Nacirema – by Horace Miner – *from American Anthropologist*, 1956, 58(3), 503-507 – <http://www.sfu.ca/~palys/Miner-1956-BodyRitualAmongTheNacirema.pdf>

In regard to the summative assessment of learning, student narratives should apply learning around preservation methods from their hypothetical and they should creatively produce a demonstration of the significance of analysis of evidence to infer purpose and understanding. Even though the hypothetical discovery occurs 5,000 years in the future and there will be proof of written evidence on the artefacts, students could be asked to decipher the language or interpret it in an interesting or humorous way. Encourage students to support their narrative with photos of the artefacts and allow multimodal opportunities for students if needed.

Students can:

- Identify methods of preservation that allow historians to study the past.
- Demonstrate how historians and anthropologists attempt to interpret primary evidence.
- Apply SSL where appropriate.

Unit sequence	Time tools: Measuring the past Learning intentions: Understand how historical evidence is revealed	
Teaching and learning	Teacher tips and alerts	Evidence of understanding
Subject specific language • Archaeologist: Studies human history, especially ancient history, through excavation of sites and analysis of artefacts • Excavation: Systematically exposing and processing remains, usually from the ground • Stereotype: A widely held but oversimplified idea or image, in this case of a career • Palaeontology: Branch of science concerned with fossilised animals and plants • Tutankhamun: Egyptian pharaoh, died 1324 BCE • In situ: In its original place • LiDAR: Technology for measuring distance by reflection of a laser, can form 3D scans • Interpretation: In history, an explanation of evidence based on deep investigation • Cataloguing: Recording a systematic list, like a library catalogue • Cross-checking: Using multiple sources to verify accuracy of evidence • Hieroglyphs: Logographic writing system of ancient Egypt	Examine the subject specific language (SSL) for each unit sequence, using this terminology in delivering content and context and expecting it to be reapplied by students to demonstrate understanding. Create living documents where possible open to modification, growth and development as critical parts of the learning process develop. One form this can take is a Word Wall of SSL, adding terms as they are raised within the learning process. Placement in visible locations in the classroom will allow students to refer to SSL during dialogic and written exercises.	
Tuning in Ask the students to consider the following question: • What is an archaeologist? Use the aforementioned prompt to draw what they think archaeologists look like on the following living document with their annotations to include terms, objects, outfits and tools and where they might be located. Resource 4 – What does archaeology look like Video resource • ‘Solving mysteries with archaeologists’ – <i>SciShow kids</i> – 4:36 – https://youtu.be/zOJICdMvWAI Clarify the difference between archaeology and palaeontology with students correcting any stereotypes they may have demonstrated on their living image of the archaeologist, adding additional terms and ideas to the image where appropriate.	Tease out the stereotypes of archaeologists with prompts such as Hollywood imagery (Indiana Jones and Rick O’Connell in <i>The Mummy</i> series), television series (<i>Ancient Aliens</i> and <i>Time Team</i>) and video games (<i>Tomb Raider</i>). Colonialism, anthropology and Social Darwinism, are entwined with the evolution of archaeological methods. For example, the British Museum acquired (and still holds) many ancient artefacts from across the world during the height of the British Empire. This is touched upon later in the unit.	Students can: Demonstrate an understanding of the role of an archaeologist.

Learning through discovery

Present the following terms, asking the class to arrange them in order of the process followed by archaeologists in a flow diagram located on the living task sheet. Students identify each stage in the top of each of the 5 boxes and write a brief reason for this stage's significance in the lower box (teacher prompts are in brackets).

- Survey (find a location)
- Grids (map out and mark out)
- Excavate (dig the site)
- Map (the location of the artefacts)
- Lab (analyse the finds).

Ask students the following question:

- Has anyone heard of the **Tutankhamun**?

Share any pre-existing understanding of the discovery and **excavation** of Tutankhamun's tomb in 1922/23 CE.

Watch the following video to develop an overview of the discovery of the tomb of Tutankhamun.

Video resource

- 'The Discovery of KING TUT | The Antechamber' – *The discovery of King Tut – 3:17* - <https://bit.ly/3a7IXqI>

Examine the photographic evidence Harry Burton took of Tutankhamun's tomb being excavated, to identify the methods and tools used by Carter's team.

Online resource

- 'Discovering Tutankhamun in colour' – *The Griffith Institute* – University of Oxford – <https://bit.ly/3gzTWu9>

Students respond to the images and annotations attached to each image by documenting as many ideas as possible, prompted by the following resource:

Resource 5 – What can we see

Ask students to identify where there is clear evidence of **cataloguing** in the photographs, asking them to consider:

- Why would accurate cataloguing be an important aspect of archaeology?

Students add the skills and character traits archaeologists need to have around the living image of their archaeologist.

Identify contemporary technologies used by archaeologists such as the application of **LiDAR**.

Read the following article (approx. 2-minute read) to the class, watching the video that is embedded within the article.

Online resource

- 'LiDAR' - National Geographic – 1:24 – <https://on.natgeo.com/33CkY0x>

After watching the video regarding the application of LiDAR technology students can add additional ideas and learning to their living archaeologist document.

Display the Google Maps image of the Valley of the Kings in Egypt for students to identify and document challenges this environment would create for archaeology in the past and the present.

When students undertake the flow diagram in the 'What do archaeologists look like' resource, the order in the teaching and learning is the correct order as long as you clarify information derived from the video resource. Marking out a grid is mapping out the dig, however when we use the term 'map' in the advice we are referring to 'mapping the artefacts location' which would occur after initial surveying, grid layout and excavation. This contestability of the order should create great teaching moments for students to consider the correct order, therefore developing an understanding of the processes followed.

Tutankhamun is used as an infamous example here but could be substituted by examples from other ancient cultures if students go on to cover this in the Egypt depth study instead. Tutankhamun's mask is an icon of ancient history. Howard Carter's opening of Tutankhamun's tomb in 1922-23 is probably the most well-known archaeological moment across the world. It has helped put a romanticised idea of the 'adventure archaeologist' - uncovering ancient treasure - into our popular culture. 'Tutankhamun's curse' can be used as a hook for students but is a myth, not history.

The video recommendation with the discovery of the antechamber allows students to consider that the narrator is identifying reproductions of the artefacts that have been examined meticulously and contextualised within a vast developing understanding of ancient Egyptian history. Learning from this video can be buttressed with the following video which continues the exploration of the tomb:

- The Discovery of KING TUT | The Burial Chamber and Treasury – *The Discovery of King Tut – 3:12* – <https://www.youtube.com/watch?v=x9u3or9Eedw>

An alternative option to the projection of the Burton photos is to print out the images for students to peruse and examine in small groups. When students assess the images to respond to the prompted questions note the:

- Hands-on approach (including removing artefacts to get deeper into the tomb).
- Cataloguing through small numbered cards visible in the photographs allows objects to be referred to when further investigated, but also secures a record of what is actually in the tomb. The issue around theft and tomb raiding during excavation should also be considered.
- Howard Carter worked on cataloguing the contents of Tutankhamun's tomb through to the 1930s.
- Purpose of photographing objects in situ (note the original photographs were black and white). The fragile condition of many artefacts should be considered.

Students can:

- Identify traits of archelogy through observation of images and video.
- Understand the processes archaeology follows.
- List the traits an archaeologist needs to have to discover and interpret the past.
- Develop a historical lens that allows inferences using different sources.

Online resource • ‘Tomb of Tut Ankh Amun’ – Google Maps (satellite) – https://bit.ly/39X32Pg Ask students the following question: • How would this type of mapping technology help archaeologists? Add more information to the grid resource on the nature of the site and additional tools archaeologists could apply. Students can speculate how the excavation might be done more professionally now, 100 years after the discovery of hidden Egyptian tombs such as Tutankhamun’s.	• Ways that the team may have compromised evidence (damage like breaking door seals). • Limitations of technology, lighting and difficulty manoeuvring through the site and landscape. • Tools used appear to be small and simple. When viewing the Google Maps satellite technology ask students to recognise the challenging features of the environment such as its remoteness and mountainous topography. Would this have been a factor when selecting the location as it contained the tombs of pharaohs? Students should record additional observations from this exercise onto their ‘what can we see grid’ in regard to the difficulty of the site and the types of instruments used. Shape class discussion around valuing and conserving ancient sites with prompting around what we would lose from our understanding of ancient history if Tutankhamun’s tomb had been raided in the past, like many other tombs were. The conservation of ancient history will be discussed again at the end of the depth study. In setting the scene for the Otzi the Iceman and Mungo Man case studies that follow, establish student understanding of what ancient historians do and how their work differs from historians of the modern world.	
Masking the truth Ask students the following question: • Have you ever seen the death mask of Tutankhamun? Draw on students pre-existing knowledge of this significant ancient artefact, presenting and examining the following HD image: Online resource • ‘King Tut Mask front and back’ - <i>Wikimedia commons</i> - https://bit.ly/3fFvWVr Resource 6 – Tutankhamun’s mask Small groups can scrutinise the image to create an original interpretation of the 7 points of interest, using no additional research to undertake the ‘What I currently think’ column. Moderate student discussion providing students with the following online resource, modelling its use as a valuable tool in examining the mask in detail and allowing time to complete their independent interpretation of the artefact. Online resource • ‘Tutankhamun golden Mask - 3D interactive model’ - <i>Sketchfab</i> - https://bit.ly/2XOE7sr Students can start examining the annotations on the 3D model to start populating the ‘What I found out’ column.	Just as geography has shifted from hand-drawn maps to technology like Google Maps; methods and tools for investigating the ancient past have changed dramatically too. Some of these technologies will arise in this sub-section. The 3D interactive tool is an amazing tool to examine the mask in detail and for students to initially draw their own group interpretations of the artefact. By examining the annotations in the interactive display provided, students will start developing an understanding of the historical content to be examined. The following points will allow teachers to support learning and engage curiosity regarding student research: • The materials it is made from - students will probably say gold and/or valuable jewels and stone. It’s important to also note the gold was believed to contain magical properties. • Its age - students will probably not date the mask exactly but will use terms such as ‘very’ or ‘thousands’, even ‘millennia’. Note: recent carbon dating epochs it to 1,323 BCE, approximately 3,300 years old. • Its purpose - the significance of funerary practices and the significance of the afterlife was paramount to Egyptian belief	Students can: • Collaborate to examine and analyse evidence. • Research and develop understanding. • Apply different technologies to develop understanding. • Demonstrate understanding of the soft and hard skills necessary to develop historical understanding. • Communicate understanding in an appropriate form.

Groups use other available online and physical resources to establish correct historical understandings of the nature of the mask. **Cross-checking** evidence is critical for building an accurate picture of ancient history.

After appropriate research time watch the following video to allow students to cross-check their developing understanding.

Video resource

- ‘The Discovery of KING TUT | The Gold Mask’ – *The Discovery of King Tut* - 3:43 - <https://bit.ly/2PuahEM>

Students can tick the final box, or identify the source in an appropriate convention, validating their group research.

A tough job: Summative assessment

Students create a job description in a multimodal form, such as an infographic for an archaeologist, addressing how this profession allows historical understanding to exist. Students need to apply SSL where appropriate to shape the nature of this career.

Students need to identify and explain the importance of:

- Soft skills - character traits, personal skills, qualities
- Hard skills - aptitudes, technological awareness, proficiencies, equipment and tools
- Place - locations expected to work in, places you might need to travel to, conditions you might face
- Thinking - type of thinking skills that are valuable in the field and why.

Encourage students to use online resources to detail and elaborate on additional skills and qualities, as needed. Include thoughtful responses to the following:

- the hardest part of being an archaeologist could be ...
- to create secondary sources of evidence you will need to be able to ...
- interpretation of evidence is critical because ...

systems, with the mask’s image of the person allowing them to be recognised in the afterlife.

- The inscriptions on the front and back of the collar - an important point to raise would be around hieroglyphs and the ability to translate them is significant in understanding how the tributes, spells and charms located on the collar were aimed at protecting the boy king through his journey in the underworld.
- The symbols on the forehead - the vulture and cobra, were symbols of the ‘Two Lands of Upper and Lower Egypt’ and of divine authority.
- The long beard on the chin - false beards were worn by pharaohs, as sacred symbols of the gods, at ceremonies, giving them god-like status.
- The dark makeup around the eyes – Kohl, made of the mineral Galena was used as a symbol of beautification. The minerals kept insects away and also offered some protection from the bright Egyptian sun (NFL players today apply similar makeup under their eyes to reduce glare).

When cross-checking within the sources, develop detail according to your class cohort. Students may simply write 3D Sketch Fab Model, Grand Egyptian Museum, the URL, A Harvard Author Date reference or simply ‘my HASS teacher’. When students are **cross-checking** they may simply ‘tick’ that a second source was applied such as a video or produce more specific and detailed descriptions.

A useful second source for students is:

- ‘King Tut Mask’ - *History embalmed* - <https://bit.ly/2Xzwgia>

In regard to the summative assessment, develop student understanding of hard and soft skills by providing examples of where they exist in their real worlds such as sporting clubs, associations or workplaces. Students should use information from tasks and exercises within the unit to create an informative and creative representation of the traits needed to allow people to find, analyse and interpret primary evidence to develop historical understanding.

SSL such as cross-checking, interpretation, cataloguing, primary and secondary evidence, artefacts, etc should be applied to demonstrate understanding.

Unit sequence	Tutankhamun: A mysterious death Learning intentions: How the analysis of ancient human remains answers an historical mystery	
Teaching and learning	Teacher tips and alerts	Evidence of understanding
Subject specific language • Theory: A group of linked and tested ideas that are aimed at explaining something • Contestability: Open to challenge and debate • Assassination: The killing of a prominent person • Inbreeding: The mating of individuals who are closely related which can lead to birth defects • Malaria: An often-fatal disease transmitted by mosquitos • Tutankhamun syndrome: Common name for a medical condition with symptoms such as pigeon breast development, sagging abdominal wall and flat feet • Compound fracture: A break in the bone where it protrudes from the skin • Club foot: A deformity of the foot where it is turned inward • CT Scan: Machine that produced detailed, explicit internal images of the body	Examine the subject specific language (SSL) for each unit sequence, using this terminology in delivering content and context and expecting it to be reapplied by students to demonstrate understanding. Create living documents where possible, open to modification, growth and development as critical parts of the learning process develop. One form this can take is a Word Wall of SSL, adding terms as they are raised within the learning process. Placement in visible locations in the classroom will allow students to refer to SSL during dialogic and written exercises.	
Tuning in Ask the students to consider the following question: • What might be the most difficult part of examining ancient human remains, in particular mummified Egyptians? Class discussion should reflect on previous examination of human preservation explored in the first unit sequence in respect to how bodies are preserved as well as challenges such as deterioration, fragility, or cultural sensitivities. Clarify how contestability is an important consideration when interpreting evidence and how this may appear in examining damage or injury to human remains. Students are encouraged to draw on the previous examination of the discovery of Tutankhamun to foster discussion and re-establish pre-existing understanding.	When examining human remains, cultural sensitivities should be considered, especially in regard to still-living cultures. When examining ancient Egyptian remains, particularly those of pharaoh Tutankhamun, the fragile condition and processes followed in mummification created difficulties in regard to access to evidence, using traditional observations of evidence. When discussing contestability, clarify to students that the excavation, extraction and transport of human remains in the past has often been very physical and caused damage to remains and ruins. Consideration should be given to the fact that embalming of bodies involved the use of resins, bandages and encasing of remains which can damage or distort remains, which are then examined by historians and scientists.	Students can: Reflect on prior learning to generate ideas around contestability and sensitivities on exhuming human remains.
A mysterious death Ask students to consider the following question: • Would a pharaoh's life be more at risk than any other ancient Egyptians? Prompt class discussion around how a pharaoh might be a target or be involved in activities that might place them more at risk to harm. Clarify to the class that the theory of Tutankhamun's death has mystified historians for decades. Students have to work in teams of four. Each of the four students undertakes an individual investigation, examining 1 theory regarding the death of Tutankhamun using the following prompts: • Murder or assassination • A fall or accident	When prompting discussion around the 'risks of being a pharaoh' provide opportunities for discussion around the kind of activities that could be considered risky by a pharaoh. There are several examples of pharaohs who were active militarily or partook in activities that were probably risky such as hunting megafauna eg lions. The development of new technologies is a significant angle of study with the complicated condition of the body and the embalming of the Pharaohs' bodies creating a series of problems for historians. With each of the four studies, students should be encouraged to elaborate their research, demonstrating an informed understanding to challenge and debate discussion within this unit.	Students can: • Undertake an inquiry into one theory regarding Tutankhamun's cause of death. • Identify and analyse resources and texts that are reliable. • Reference a source, applying an appropriate convention. • Analyse information regarding an investigation.

• Frail health and disorders due to inbreeding • A disease. Familiarise students with SSL that may appear within their investigation, allowing them to contribute any prior understanding such as malaria, Tutankhamun syndrome, compound fracture, club foot and CT Scan. <u>Resource 7 – Tutankhamun Investigation</u> Students in each team use the supporting resource to individually investigate their theory. Within their shared task students have to identify the role of an expert and piece of equipment or technology used in the investigation as well as summarising their findings. Monitor, moderate and prompt student investigation where needed. The following sources provide useful information and should be linked to students, however independent investigation should be encouraged: Online resource • ‘What Killed Tutankhamun?’ – <i>History Extra</i> – https://bit.ly/2XLuSjg Online video • ‘Who or what killed King Tut? – Egypt's most famous pharaoh 60 Minutes Australia’ – <i>60 Minutes Australia</i> – 14:13 – https://www.youtube.com/watch?v=EZYMC-bP7gE With appropriate individual research time provided, each team is encouraged to present, debate and contest their findings whilst being encouraged to link evidence and theories to develop and document more sophisticated explanations or plausible conditions and situations leading to King Tut’s death. Students return to the class group to share, challenge and debate their theories and discoveries. Each team presents a spokesperson with the class possibly reaching a consensus of their findings and documenting any new elaborations and evidence. What killed Tut?: Summative assessment Students produce a brief video or written exposition that responds to the following statement: ‘We have to thank technology, human expertise and teamwork for helping us discover Pharaoh Tutankhamun’s cause of death.’ Within the response students should present how the aforementioned factors contributed to the truth being revealed regarding Tut’s cause of death through critical investigation and the contesting of findings between teams and the class cohort. Students should reflect on their original thinking and how that may have changed over the investigation.	Student roles are not to defend their position or theory, but to reveal discoveries via investigation, and if need be, dismiss their theory or link it to another factor relating to his death. Use appropriate resources to undertake the study with the online resources provided allowing for an excellent body. When developing teams of four irregular numbers may mean one student undertakes two studies. Within teams consider the ability skill set of individual students, allowing individual studies to be geared to student interest and ability. When students are undertaking their investigation monitor and moderate the guiding of resources that are appropriately levelled, prompting searches with appropriate terms and SSL that relates to their investigation. In regard to the summative assessment, this provides a great opportunity for students to demonstrate findings and learnings, as well as identifying why expertise and technology are significant tools used to develop historical understanding and learning. Students should present learning around what teamwork within their class cohort as well as amongst researchers revealed in their investigation, how it assisted in developing a consensus and a rich understanding of the cause of death of Tutankhamun. Points to elaborate with students regarding their individual exposition could include consideration given to: • technology – examples, SSL, timescales of application and what they revealed • expertise – individuals’ or organisations’ level of authority and study, experience and examination that allows expertise to develop • teamwork – bias, debate, challenge, scale, contestability and individual contributions.	• Develop, debate or challenge a theory based on research within a collaborative group. • Produce a representation of learning that demonstrates consideration and development of understanding of their inquiry.
---	---	--

Unit sequence	Australian stories: Mungo man Learning intentions: Understand how Mungo man can tell us about how people lived in the past	
Teaching and learning	Teacher tips and alerts	Evidence of understanding
Subject specific language • Out of Africa theory: Scientific theory that all humans migrated from central Africa approx 200,000 years ago • Land bridges: A corridor of land humans can cross that appears as sea levels fall • Lake Mungo: A dry freshwater lake in NSW that is part of the Willandra Lake system that borders NSW, SA and VIC • Willandra Lakes: UNESCO World Heritage listed site that contains both natural and human significance • Mungo man: The name given to a 42,000-year-old skeleton found near Lake Mungo. • Ceremony: A formal service • Ritual: A procedure or action that's a custom • Ochre: Natural clay powder mixture often used as a paint • Midden: A pile of food scraps, shells and other waste • Hearth: Floor of a fireplace • Flakes: Stone throwaway knives • Archive: An historical document or record	Examine the subject specific language (SSL) for each unit sequence, using this terminology in delivering content and context and expecting it to be reapplied by students to demonstrate understanding. Create living documents where possible, open to modification, growth and development as critical parts of the learning process develop. One form this can take is a Word Wall of SSL, adding terms as they are raised within the learning process. Placement in visible locations in the classroom will allow students to refer to SSL during dialogic and written exercises.	
Tuning in Display the following street view link to draw students' attention to Lake Mungo in South Western NSW, in particular to the sand dunes and flatness of the terrain. • 'Lake Mungo – (Street View to Lake Mungo viewing platform)' – <i>Google Maps</i> – https://bit.ly/2PNlnEV Point out that the dry lake is a National Park and the street view will allow exploration from an aerial view of the Willandra Lakes region. Students can postulate what we may be studying in this unit sequence. Watch the following brief video Video resource • 'Mungo Man' – Behind the News – (BTN) – 3:36 – https://ab.co/2DWCjpR Discussion around findings and facts from the video should be valued with students developing understanding that while the Mungo man discovery established scientific understanding, it also holds significant cultural importance to the original owners of the region.	This unit sequence examines the accidental discovery of the oldest human remains in Australia, in the sand dunes at Lake Mungo, 1974. The 42,000-year-old Mungo man skeleton was a significant find as it allows us to date occupancy and appreciate the daily life and community of the Aboriginal people who lived there, as well as recognising and understanding everyday life and the use of natural resources, customs and belief systems, skills, and the effect of climate change (the return of Mungo man's remains will be addressed in the next unit sequence). Be aware that Lake Mungo was a vast inland freshwater lake and started drying approximately 50,000 years ago. It has been completely dry for about 10,000 years. Three skeletons have been found in that region and each has contributed to the historical understanding in some way. Before teaching this unit listen to this following podcast which identifies key people involved and provides fantastic background knowledge on this unit sequence. • The Death and Afterlife of Mungo Man Beyond the Lab - (podcast) <i>ABC Local</i> – 28:02 – https://www.abc.net.au/local/programs/438-beyond-the-lab/episodes/ep-2015-11-21-4356610.htm Consider the fact that Mungo lady and Mungo man's remains are separated by approximately 20,000 years, yet the rituals followed on all remains were similar. Consider Aboriginal and Torres Strait Islander perspectives on issues like the removal and returning of ancient remains.	Students can: Demonstrate a sound understanding of the landscape of Lake Mungo and the significant discoveries there.

Out of Africa Ask the students to consider the following question: • Could all humans have originated from the same place? Value students' thinking and contributions providing clarification that there is a theory that attempts to explain our human origins that is called the out of Africa theory. Watch the following video: Online video • 'Map Shows How Humans Migrated Across The Globe' – <i>Science Insider</i> – 2:23 – https://bit.ly/30LSaRq After the video, clarify and document the following points: • origin: approx 200,000 years ago from central Africa • direction: Northwards and then east towards Australia • Australia: arrival via land bridges in the north approx 50,000 years ago. Read the following resource with the class. Resource 8 – Out of Africa Foster a class discussion around new content and context, replicating the migration on Google Maps, a classroom map or a tactile globe of the world. Students write a brief written response to the following questions: • How do the videos and readings demonstrate one interpretation of the historical technique of cross-checking? • Provide 3 ways the development of a spoken language would have aided migration? • Why might humans have 'hugged the coast' when making vast migrations? • How do the time scales of major events and migrations of people provided in the out of Africa resources match with dating of the Lake Mungo remains?	The skeletal remains and archaeological evidence discovered at Lake Mungo establishes a measure for habitation of the Australian continent and can be coupled with content knowledge surrounding the out of Africa theory to demonstrate how historians attempt to build an explanation of the past using scientific research and archaeological evidence. The video resource recommended is a CGI animation showing the direction of migration that is believed was followed by humans in the out of Africa theory. However there are several useful videos online which elaborate and provide further levels of detail if needed for students to develop deeper understanding: • 'Human Prehistory 101 (Part 1 of 3): Out of (Eastern) Africa' - <i>23andMe</i> – 5:34 (student friendly description of human migration with illustrations to support narrative) https://www.youtube.com/watch?v=8183HPmA2_I • 'OUT OF AFRICA Update' – <i>ABC Science</i> – 12:39 (explains ongoing investigation and DNA evidence being applied to map the out of Africa theory) https://www.youtube.com/watch?v=7_MnQvPK_FA • 'The single migration out of Africa that populated the globe' – <i>Quartz</i> – 1:08 (CGI animation showing the movements of people across the globe supported by time scales and causes of migration) https://www.youtube.com/watch?v=2bKAKFkKTfw	Students can: • Demonstrate an understanding of the out of Africa theory. • Relate and link a theory to the study of the Lake Mungo skeletal remains. • Infer how human migrations may have been motivated and aided.
Life on the shores of Lake Mungo Ask the students to consider the following question: • What might life have been like on the shores of Lake Mungo several thousand years ago? Brainstorm some of the activities they might expect to witness on the shores of this fresh water lake. Show the following image: Online resource • 'Lake Mungo People, 1974 (artistic representation) Giovanni Caselli' – <i>National Museum of Australia</i> – https://www.nma.gov.au/learn/kspace/lake-mungo-45000-years-ago/kids Students are given appropriate wait time to evaluate and analyse the image to record ideas using: Resource 9 – Lake Mungo Clarify with students whether this is a primary or secondary source of evidence, adding that the artist was an archaeologist as well.	Evidence, in the form of continuous archaeological research and examination of Mungo man (and other skeletal remains) combined with the collation of other sources of evidence from the Willandra Lakes region has allowed historians to compose an image of life in that region thousands of years ago. Coupling this knowledge with other archaeological finds in the area allows a picture of life that existed on the shores of Lake Mungo to develop. When presenting Giovanni Caselli's painting, consider projecting or printing copies for students to examine and analyse in small groups if needed.	Students can: • Examine and analyse an image to identify relative information. • Identify a source as a primary or secondary source of evidence.

Students share analysis of the image documenting other evaluations, interpretations and assessments.		
A Mungo investigation Ask students to consider the following question: • Other than the human remains discovered at Lake Mungo, what other evidence of human habitation might still be there? Brainstorm ideas and thinking, drawing out types of evidence students think humans may leave behind after thousands of years since habitation. Before students continue their research, acknowledge and identify the three tribal groups of Aboriginal people that share this traditional country: the Paakantji, Ngyiampaa and Mutthi Mutthi people. Students get into 5 groups to undertake an exploration of one aspect of the Mungo discovery which will be shared with the class to develop a shared learning. Each group is to undertake independent research into each of the following artefacts and remains: • Stone artefacts (flakes) • Middens • Fireplaces (hearths) • Burial ritual (ochres) • Mungo man skeletal remains Each team must present their findings regarding the following back to the class: • brief definition and description of the evidence • photographic evidence to support delivery and communication • technology used to examine the evidence and develop understanding • what they tell us about the people, beliefs or practices of people living on the banks of Lake Mungo • reference their sources using an appropriate convention • students complete a CRAAP test on one of the sources used. Resource 10 – CRAAP test The following online resource provides an excellent basis of content for the study with students in groups reading, comprehending and using strategies such as closed reading or modified literature circles to unpack the texts from the recommended and other sources. Online resource ‘Mungo Archaeology’ - Mungo National Park - http://www.visitmungo.com.au/signs-from-the-past Learning particularly around the ceremonial burial practice can be supported with the following online resources which should be used as a stimulus for student investigation: • ‘Mungo Man’ (burial practice) – First Peoples – PBS – https://www.bbc.com/news/world-australia-42020675 • ‘The Range of Sources – Lake mungo Willandra Lakes – Stone artefacts, middens and fireplaces’ (PDF) – Macquarie University – https://bit.ly/2F9AI0B	The use of online resources and multiple medias to present the evidence from digs and excavations whilst encouraging rich dialogue allows multiple entry points for student learning. Establish understanding that the freshwater was teaming with marine life and its shores populated by people, wildlife and flora. For example, when discussing shell middens, point out that shells can accumulate naturally on the lakeshores. What makes it a midden however is the shells consistent size, unbroken nature (wave action on the shore would break them) and the fact they are baked allows us to know it’s not a random natural accumulation. Discussion around the fact that plant matter and other soft material has not preserved well in the Mungo environment should be addressed. Group the evidence and its nature into teachable chunks identifying the skill or instrumentation used to extract and measure the evidence where possible. Determine the fact that the archaeological materials are hard and durable and include skeletons (three), stone artefacts, fire baked sediments, middens, etc When acknowledging the traditional owners of the Willandra Lakes region, learning can be scaffolded by supporting students to examine the diversity of Tribal/Language groups within the region using the following interactive map. Note that pronunciation and spelling of these groups may be different: http://nationalunitygovernment.org/pdf/aboriginal-australia-map.pdf Moderate and support student investigation and inquiry into research by providing the groups ideas, such as the following taken from the online resource recommended: • stone artefacts - grindstones, flakes and points, knives and axes used for milling, hunting, cleaning, fishing, etc • middens - containing shellfish, fish, mussels, yabbies and small mammals. • Fireplaces (hearths) - fire pits can be carbon dated and facilitated cooking and heating. • burials - rituals such as the positioning of hands and body, removed teeth, sprinkling of ochre as well as fire nearby as evidence of spiritual belief and ceremony, and evidence of an ancient trade route in ochre that’s existed for millennia. An explanation of Mungo man’s skeletal remains should include: • physical features - sex, height, weight, age • pre-existing health issues - arthritis in spear throwing arms, elbow • teeth - some missing, possibly from initiation ritual and wear on his molars due to using them to strip reeds to make twine. Information to display to support student understanding of a CRAAP test can be found at: • ‘CRAAP TEST’ – Academic English UK – https://www.academic-englishuk.com/wp-content/uploads/2018/07/CRAAP-Test-AEUK-1.pdf	Students can: • Offer suggestions based on prior learning regarding types of ancient evidence. • Collaborate to research and develop an understanding. • Communicate information relevant to an inquiry. • Acknowledge sources of information. • Evaluate the reliability of a source applying an appropriate convention.

• ‘Mungo National Park, New South Wales’ – <i>Australian Geographic</i> – 2:39 – https://bit.ly/3apTOGJ Groups present their findings using appropriate forms such as class presentation, video or group sharing activity via a rotating table system with each group documenting additional learning and key learning. Resource 11 – Mungo findings Students write a 3-minute quickwrite about what they think life would have been like on the shores of Lake Mungo several thousand years ago, considering the community’s wellbeing and lifestyle. Art or archive?: Summative assessment Revisit the secondary source: Lake Mungo People, 1974 (artistic representation) by Giovanni Caselli, examined earlier in this unit. Buttressed by additional learning, students write or create a video exposition arguing and defending that this artwork is not just art but an archive of life at the time. Students need to identify and defend the representations in the image annotating, elaborating and providing evidence from the individual and shared resources created, as well as additional resources where necessary. Students reference the original artwork using an appropriate convention and apply SSL where necessary to demonstrate learning.	Close reading and modified literature circles are effective strategies to allow students to access content and context within text: • How to do a close reading – <i>teachLike This</i> – 4:13 – https://www.youtube.com/watch?v=l_hhMeE7Osw • Developing Collaborative Conversations Through Literature Circles – <i>SanBdoCitySchools</i> – 10:56 – https://www.youtube.com/watch?v=t5MIRQ5c0Ws In regard to the summative task students have to re-examine the painting to identify new learnings such as grindstones and flakes and could also assume the man carrying the hunted kangaroo could have been Mungo man. The argument should defend the validity and detail that Giovanni Casselli applied to the image to allow it to be an effective and reliable source of secondary evidence. Students could create a video with annotations of activities, artefacts and evidence presented in the image or a written exposition. Multimodal forms should be promoted with students utilising appropriate technologies where available.	
---	--	--

Unit sequence	Protecting our past: Keeping the legacy Learning intentions: Understand why we should and how we can protect our heritage	
Teaching and learning	Teacher tips and alerts	Evidence of understanding
Subject specific language • Repatriation: To be returned to your home or country • Conservation: The protection of natural and human made environments and artefacts • Heritage: Places, creations and traditions with value to a culture/society • Tangible: Something you can touch • Intangible: Something you can't touch • Natural heritage: Made by nature • Cultural heritage: Made by humans • Criteria: The standards that need to be met for selection • UNESCO: The United Nations Educational, Scientific and Cultural Organisation	Examine the subject specific language (SSL) for each unit sequence, using this terminology in delivering content and context and expecting it to be reapplied by students to demonstrate understanding. Create living documents where possible, open to modification, growth and development as critical parts of the learning process develop. One form this can take is a Word Wall of SSL, adding terms as they are raised within the learning process. Placement in visible locations in the classroom will allow students to refer to SSL during dialogic and written exercises.	
Tuning in Ask students to consider the following question: • Should Mungo man's remains be repatriated? After clarifying the term repatriation , encourage a robust discussion around the status of the remains, stating that the point of this exercise is not to pick a side but present as many perspectives as possible. Display class brainstorming on a simple T-chart with reasons and vested interest groups recognised for both positions with students completing the following task sheet: Resource 12 – Mungo man's repatriation Watch the following video: Online resource • 'Mungo man handed back to traditional owners for long journey home' – <i>NITV News</i> – 2:54 – https://www.youtube.com/watch?v=8Jlb39aQ5Vo Ask students to consider the following question: • At the end of this video, where are the remains? Continue the class discussion adding more information to their T-chart and noting the currency (date) of the video as Dec 14, 2015. Clarify that the remains were in the possession of the traditional owners of the land. Watch the following video paying particular attention to the concepts of empathy and significance as well as the currency (date) of the video as Nov 16, 2017. Online resource • 'MUNGO MAN: Going Home' – <i>Sovereign Union</i> – 6:53 – https://www.youtube.com/watch?v=PnjNeRuumoo	This tuning in exercise allows students to segue from the previous unit's work into examining how we conserve the past and considerations that need to be given to different communities that are invested or have connections with remains and artefacts. Be aware, discussions around culture, heritage and faith can be sensitive to some students so proceed cautiously and respectfully. Discussions around why people maintain many elements of their heritage could generate some issues around innate fear and racism so proceed with respect and thoughtfulness. When identifying vested interest groups that could be involved in this discussion, specify the 3 particular language groups of the traditional owners of the Willandra Lakes region, the Paakantji, Ngyiampaa and Mutthi Mutthi people. Include particular professions within the chart such as archaeologists, palaeontologists, historians, scientists and anthropologists. When discussing the videos, consider how respectful and emotional the repatriation of the remains is for the traditional people of the Willandra Lakes.	Students can: • Consider some of the sensitivities and challenges facing repatriation of human remains. • Develop empathy on the sensitivities and challenges around repatriation. • Understand how different perspectives on the value of discoveries to different groups.

Ask students to consider the following question: • At the end of this video where are the remains? Students complete a brief recount of the importance of this ceremony and repatriation of the remains to the traditional owners of the Willandra Lakes region, in particular how respect was expressed.		
Identifying heritage Ask the students to consider the following question: • What is the relationship between heritage and conservation? Clarify the meaning of heritage and conservation with students deducing that one protects the other. Students could reflect on prior unit sequences where they reflected and interpreted the significance of everyday objects to tell us about our past. Ask students to identify whether all heritage is tangible or whether some elements of history are intangible, clarifying the meaning of both terms. Provide students with examples to categorise into the two groups on the board such as: • storytelling • building • forest • language • samurai sword • dance moves • unique desert landscape • vase • knowledge. Encourage students to provide additional examples such as: • the unique, ancient sand and landform formations at the Willandra Lakes region • the Mungo remains and artefacts of ancient beliefs and habitation at Willandra lakes region. Clarify the meaning of natural heritage and cultural heritage with students ask to identify: • Which of the two heritage examples at Willandra Lakes fits each type of heritage? Students identify the two on the following task sheet populating it with sketches and examples from the previous exercises as well as original more explicit examples like the Sydney Opera House and Uluru. Students can be asked to share and document places they've visited that they feel should be acknowledged. Resource 13 – Types of heritage In the space between cultural and natural heritage students should record a statement about what these two types of heritage share and why they are significant.	Students may be familiar with the concept of environmental conservation (natural heritage) but in this context, conservation is about protecting what's left of human history from the past. This can also be described as cultural heritage. Societies consciously or unconsciously make decisions about what cultural heritage they believe is significant and worth keeping. Culture moves on and adapts, but some traditions and mementoes are looked after and others discarded. For tangible heritage, unfortunately we can't keep everything – conservation can be very expensive (consider what costs). For intangible heritage, it can be difficult to record in a way that future generations will understand and sometimes the transmission of knowledge and skills is cut (think Stolen Generations). When undertaking the exercises within this sub-section students should demonstrate clarity in how we define heritage and the variety of forms it takes. Students should be encouraged to populate their diagram with known examples of places they believe are valuable natural spaces and places as well as human creations or constructions that are culturally significant to particular groups or even humanity. Students' personal travel experiences locally, nationally and abroad should be valued and shared as well, adding to the learning.	Students can: • Identify the attributes of heritage. • Understand that there are different types of heritage and identify them. • Identify the significance of heritage to different groups.

UNESCO World Heritage sites: Protecting the past

Ask the students to consider the following question:

- What do you think the acronym UNESCO stands for?

Brainstorm any student presumptions or guesses and clarify the acronym and UNESCO's mission.

Watch the following video:

Video resource

- 'World Heritage explained – animated short about the UNESCO World Heritage Convention (English)' - *UNESCO Commission* – 2:08 – <https://www.youtube.com/watch?v=IOzxUVCCSug>

Students can:

- Write one sentence that you think best describes the role of the UNESCO World Heritage list.

Present the following descending numbers to students on the board, elaborating on each after students' attempt to deduce purpose with hints provided by the teacher:

- 1,121 World Heritage sites exist
- 869 are cultural sites
- 213 are natural sites
- 39 are mixed
- 19 are in Australia
- 10 **criteria** exist that identify places as significant enough to be on the list
- 6 of those criteria are based on cultural features
- 4 of those criteria are based on natural features
- 2 types of heritage are identified in the criteria, cultural and natural (some places meet both)
- 1 of the criteria has to be met to be placed on the list however some places meet several.

Students can be asked to brainstorm which places they think are on the list in Australia as well as what they think the criteria might be.

Resource 14 – UNESCO criteria

Think, pair, share, in 10 groups using the resource to simplify one of the criteria and share with the class, providing one example of a place or space they think may hold this criteria (locally, nationally or internationally).

Display the following interactive map of the UNESCO World Heritage List:

Online resource

- 'World Heritage List' (interactive map) – UNESCO – <https://whc.unesco.org/en/list/>

Ask students to consider the following questions:

- Where do many of the sites seem to be located?
- How many sites appear to be in danger?
- The ratio of cultural, natural and mixed sites?
- The status of Australia?
- Are the Willandra Lakes regions recognised and if so, what category?

The class can be asked to identify which criteria they think the Willandra Lakes region might meet.

Clarify to students that an acronym is formed from the initial letters of a group of other words and pronounced as a new word such as SWAT or NASA.

Discuss with students that UNESCO has a complex mandate and mission, however for the purpose of this study we will be focussing on its role to protect cultural and natural heritage. Its missions include:

- share science knowledge and policy for sustainable development
- protect, promote and share heritage
- foster cultural diversity and intercultural dialogue
- building inclusive knowledge societies through information and communication.

Students can make predictions about which sites they believe would be on the list and then discover the actual answers. They can consider what 'outstanding universal value' might mean. Look at the 10 criteria the UN uses to decide why these Australian sites are chosen, and question why Australia has more natural than cultural World Heritage sites.

When pairs or small groups are unpacking 1 of the 10 criteria, provide them appropriate discussion time to simplify and create a simple levelled explanation for the class. These can be post-it notes on the board or wall for the teacher to read if time permits, with the teacher buttressing their explanation. Student examples of a site or place they think might be on the list should allow demonstration of understanding. Though some criteria have similar traits, differentiation should be clarified by the teacher.

Consider printing colour images of one site for each of the criteria that clearly demonstrates its essence and identifier of the criteria for each group, allowing students to better decode the nature of the criteria. These can be placed on the wall or a shared space for reference.

Familiarise yourself with the interactive functions of the UNSECO World Heritage website, becoming fluent in how information, images and video can be accessed. This should be modelled to students during class time allowing them to utilise this valuable tool for their own independent learning.

When students examine the World Map of UNESCO Heritage Sites point out the vast number of cultural sites located in different regions, particularly Europe. This could be a good point of discussion around bias, however the destruction of important cultural sites in Europe during WWII should be pointed out as an impetus for the creation of the list and therefore may explain this pattern.

Students can:

- Identify examples of heritage that fit particular criteria.
- Analyse information to develop understanding.
- Utilise online tools to develop research.
- Explain the value in heritage locations that allow them to satisfy particular criteria.
- Identify how different perspectives on the value of a space and place can and does exist.
- Recognise the challenges in protecting heritage sites.
- Communicate understandings using appropriate forms and modes.

Clarify with the class how information in the form of maps can help to identify the criteria of the Willandra Lakes region in regard to:

- descriptions
- images
- video.

Students write a paragraph response to the following question:

- How does the inclusion of the Willandra Lakes region on the UNSECO World Heritage List confirm its significance to the traditional owners of the region?

Provide students access to the UNESCO interactive site to explore sites of interest and familiarise themselves with this valuable leaning tool.

Worth conserving: Summative assessment

Students are to undertake an individual investigation into sites on the World Heritage list utilising the online resources available and applying other research where needed. Students are to identify and examine 4 sites that are significant:

- to them personally
- to Aboriginal and Torres Strait Islander people
- to all humanity
- because it is in danger.

Each elaboration should reflect analysis and interpretation of the criterion used to validate its selection with students clearly recognising its heritage value and need for protection. Students can support each of the four explanations using images and maps, and SSL where needed. The presentation of learning can be multimodal with students using available technologies to communicate such as a report, podcast or a news broadcast. The merit in this exercise is student ability to demonstrate the value in protecting these specific sites, in particular with their last site. Students should be encouraged to suggest a solution or action to protect or conserve this site.

The Willandra Lakes region meets two criteria (iii and viii) and the images and video resource available on the site should be displayed to demonstrate how this site met two criteria, both cultural and natural.

In regard to the summative assessment students should be offered the opportunity to present learning in an interesting variety of formats and modes. Students have to address only 1 of the criteria for each investigation. Encourage the use of images and resources if necessary to support understanding their identification of its significance. In regard to each of the 4 areas of research students could:

- Personally reflect and relate to a site they may have visited or would love to visit locally or abroad to relate its value to their own experiences.
- Aboriginal and Torres Strait Islander people - identify how the natural and cultural value in sites within Australia link to Aboriginal and Torres Strait Islander people’s perspectives and beliefs, considering the strong values held in country and culture.
- Humanity - scale their thinking to how a site’s natural or cultural value could be seen as significant to all humanity because it has inspired values they believe are important and powerful human creations, such as literature, music, art, photography or poetry.
- Danger and risk - A site that is at risk or danger due to human or natural factors provides an interesting lens for students to identify that even though these sites are identified and protected, they still are at risk.

Assessment tasks

Assessment tasks

Assessment 1

Lost then found: Summative assessment

Students create an original narrative piece of writing where fictitious **anthropologists** discover their remains and the 5 **artefacts** from the previous task; having no idea what they were or are. The anthropologists describe the method of preservation and a creative misinterpretation of the evidence, with their descriptions of the role these artefacts played in everyday life 5,000 years prior to their discovery. Students have to demonstrate how historians might interpret why these artefacts may have been critical for individuals to participate in the civilisation at the time. In effect students will be using **primary sources** to create a **secondary source** of evidence. Students should apply SSL within their response.

Success criteria:

- describe events and developments from the perspective of different people who lived at the time
- interpret sources to identify their origin and purposefulness
- identify past events and developments that have been interpreted in different ways.

Assessment 2

A tough job: Summative assessment

Students create a job description in a multi-modal form, such as an infographic for an archaeologist, addressing how this profession allows historical understanding to exist. Students need to apply SSL where appropriate to shape the nature of this career.

Students need to identify and explain the importance of:

- Soft skills - character traits, personal skills, qualities
- Hard skills - aptitudes, technological awareness, proficiencies, equipment and tools
- Place - locations expected to work in, places you might need to travel to, conditions you might face
- Thinking - type of thinking skills that are valuable in the field and why.

Encourage students to use online resources to detail and elaborate additional skills and qualities, as needed. Include thoughtful responses to the following:

- the hardest part of being an archaeologist could be ...
- to create secondary sources of evidence you will need to be able to ...
- interpretation of evidence is critical because ...

Success criteria:

- develop questions through research to frame an historical inquiry
- develop texts by organising and presenting findings using historical terms, subject specific language, concepts, and sources
- develop texts, particularly ones that provide descriptions and explanations
- explain the role of groups and the significance of particular individuals in society.

Assessment 3

What killed Tut?: Summative assessment

Students produce a brief video or written exposition that responds to the following statement:

‘We have to thank technology, human expertise and teamwork for helping us discover Pharaoh Tutankhamun’s cause of death.’

Within the response students should present how the aforementioned factors contributed to the truth being revealed regarding Tut’s cause of death, through critical investigation and the contesting of findings between teams and the class cohort. Students should reflect on their original thinking and how that may have changed over the investigation.

Success criteria:

- examine sources to explain points of view
- develop texts by organising and presenting findings using historical terms, subject specific language, concepts, and sources
- suggest reasons for change and continuity over time.

Assessment 4

Art or archive?: Summative assessment

Revisit the secondary source: Lake Mungo People, 1974 (artistic representation) by Giovanni Caselli, examined earlier in this unit. Buttressed by additional learning, students write or create a video exposition arguing and defending that this artwork is not just art but an **archive** of life at the time. Students need to identify and defend the representations in the image annotating, elaborating and providing evidence from the individual and shared resources created, as well as additional resources where necessary. Students reference the original artwork using an appropriate convention and apply SSL where necessary to demonstrate learning.

Success criteria:

- develop questions through research to frame an historical inquiry
- develop texts, particularly ones that provide descriptions and explanations
- acknowledge their sources of information.

Assessment 5

Worth conserving: Summative assessment

Students are to undertake an individual investigation into sites on the World Heritage list utilising the online resources available and applying other research where needed. Students are to identify and examine 4 sites that are significant:

- to them personally
- to Aboriginal and Torres Strait Islander people
- to all humanity
- because it is in danger.

Each elaboration should reflect analysis and interpretation of the criterion used to validate its selection with students clearly recognising its heritage value and need for protection. Students can support each of the four explanations using images and maps, and SSL where needed. The presentation of learning can be multimodal with students using available technologies to communicate such as a report, podcast or a news broadcast. The merit in this exercise is student ability to demonstrate the value in protecting these specific sites, in particular with their last site. Students should be encouraged to suggest a solution or action to protect or conserve this site.

Success criteria:

- identify and select a range of sources and locate, compare, and use the information to answer inquiry questions
- develop texts, particularly ones that provide descriptions and explanations
- answer inquiry questions developed through locating and comparing information discovered in research.
